DISEASES OF CABBAGE: A MAJOR THREAT IN CABBAGE PRODUCTION

Black Rot
- Use certified seedlings
- Use varieties tolerant to black rot
- Rotate with non-crucifers crops

Bacterial Soft Rot
- Immediate removal of infected plants
- Avoid plant injury during weeding
- Keep the field clean

White Rot
- Avoid fields known to have high incidence of white mould
- Rotate crucifer with less susceptible crops

Healthy cabbage with no signs of diseases

Control
- Keep the field clean
- Rotate with non-crucifer crops
- Fumigate the soil with chemicals such as metham sodium

Control
- Rotate with non-crucifer crops
- Use tolerant varieties
- Use certified seedlings

Control
- Keep the field clean
- Rotate with non-crucifer crops
- Spray with Chlorothalonil and copper fungicides
